Description :

Universitas Indonesia collaborates with the local community through partnerships, in maintaining a shared aquatic ecosystem. UI's six lakes are the water conservation oases of Depok City. With the population that continues to increase, people cannot rely solely on groundwater to meet their needs for clean water. Therefore, the use of rainwater becomes one of the few alternatives to fulfill their water needs. After presenting the importance of using rainwater, the lecturers of Universitas Indonesia invited the workshop participants to conduct an experiment in purifying water from dirty water that cannot be consumed into clear water that can be consumed without neglecting the quality of the water produced.
